

1 CLAIMS

2

3 1. Apparatus for inspecting the under side of a vehicle,
4 the apparatus comprising:

5 a plurality of cameras located at predetermined
6 positions and angles relative to one another, the cameras
7 pointing in the general direction of the area of an
8 object to be inspected; and

9 image processing means provided with

10 (i) a first module for calibrating the cameras and
11 for altering the perspective of image frames from
12 said cameras and

13 (ii) a second module for constructing an accurate
14 mosaic from said altered image frames.

15

16 2. Apparatus as claimed in Claim 1 wherein the cameras are
17 stationary with respect to the vehicle.

18 3. Apparatus as claimed in Claim 1 or Claim 2 wherein the
19 plurality of cameras are arranged in a linear array.

20 4. Apparatus as claimed in any preceding Claim wherein the
21 cameras have overlapping fields of view.

22 5. Apparatus as claimed in any preceding Claim wherein the
23 first module is provided with camera positioning means
24 which calculate the predetermined position of each of
25 said cameras as a function of the camera field of view,
26 the angle of the camera to the vertical and the
27 vertical distance between the camera and the position
28 of the vehicle underside or object to be inspected.

1 6. Apparatus as claimed in Claim 5 wherein camera
2 perspective altering means are provided which apply an
3 alteration to the image frame calculated using the
4 angle information from each camera.

5 7. Apparatus as claimed in any preceding Claim wherein the
6 images from each of said cameras are altered to the
7 same scale.

8 8. Apparatus as claimed in Claim 6 or Claim 7 wherein the
9 camera perspective altering means models a shift in the
10 angle and position of each camera relative to the
11 others and determines an altered view from the camera.

12 9. Apparatus as claimed in any preceding Claim wherein the
13 first module includes camera calibration means adapted
14 to correct spherical lens distortion and/or non-equal
15 scaling of pixels and/or the skew of two image axes
16 from the perpendicular.

17 10. Apparatus as claimed in any preceding Claim wherein
18 the second module is provided with means for comparing
19 images in sequence which allows the images to be
20 overlapped.

21 11. Apparatus as claimed in Claim 10 wherein a Fourier
22 analysis of the images is conducted in order to obtain
23 the translation of x and y pixels relating the images.

24 12. A method of inspecting an area of an object, the
25 method comprising the steps of:

26 (a) positioning at least one camera, taking n image
27 frames, proximate to the object;

28 (b) acquiring a first frame from the at least one
29 camera;

- 1 (c) acquiring the next frame from said at least one
2 camera;
- 3 (d) applying calibration and perspective alterations to
4 said frames;
- 5 (e) calculating and storing mosaic parameters for said
6 frames;
- 7 (f) repeating steps (c) to (e) n-1 times; and
- 8 (g) mosaicing together the n frames from said at least
9 one camera into a single mosaiced image.
- 10 13. A method as claimed in Claim 12 wherein the object
11 is the underside of a vehicle.
- 12 14. A method as claimed in Claim 12 or Claim 13 wherein
13 a plurality of cameras is provided, each located at
14 predetermined positions and angles relative to one
15 another, the cameras pointing in the general direction
16 of the object.
- 17 15. A method as claimed in Claim 14 wherein the
18 predetermined position of each of said cameras is
19 calculated as a function of the camera field of view
20 and/or the angle of the camera to the vertical and/or
21 the vertical distance between the camera and the
22 position of the vehicle underside.
- 23 16. A method as claimed in any one of Claims 12 to 15
24 wherein images from each of said cameras are altered to
25 the same scale.
- 26 17. A method as claimed in any one of Claims 14 to 16
27 wherein perspective alteration applies a correction to
28 the image frame calculated using relative position and
29 angle information from each camera.

1 18. A method as claimed in Claim 17 wherein perspective
2 alteration models a shift in the angle and position of
3 each camera relative to the others and determines the
4 view therefrom.

5 19. A method as claimed in any one of Claims 12 to 18
6 wherein calibration of the at least one camera corrects
7 spherical lens distortion and/or non-equal scaling of
8 pixels and/or the skew of two image axes from the
9 perpendicular.

10 20. A method as claimed in any one of Claims 12 to 19
11 wherein mosaicing the images comprises comparing images
12 in sequence, applying fourier analysis to the said
13 images in order to obtain the translation in x and y
14 pixels relating the images.

15 21. A method as claimed in Claim 20 wherein the
16 translation is determined by

- 17 (a) Fourier transforming the original images;
18 (b) Computing the magnitude and phase of each of the
19 images;
20 (c) Subtracting the phases of each image;
21 (d) Averaging the magnitudes of the images; and
22 (e) Inverse Fourier transforming the result to produce a
23 correlation image.

24 22. A method as claimed in any one of Claims 12 to 21
25 wherein the positioning of the at least one camera
26 proximate to the vehicle underside is less than the
27 vehicle's road clearance.

1 23. A method of creating a reference map of an object,
2 the method comprising the steps of obtaining a single
3 mosaiced image, selecting an area of the single
4 mosaiced image and recreating or selecting the frame
5 from which said area of the mosaiced image was created.

6 24. A method as claimed in Claim 23 wherein the area of
7 the single mosaiced image is selected graphically by
8 using a cursor on a computer screen.
